

Read this important information before taking:

Oxycodone with Acetaminophen

Brought to you by the Institute for Safe Medication Practices

[Extra care is needed because oxycodone with acetaminophen is a **high-alert medicine**.]

High-alert medicines have been proven to be safe and effective. But these medicines can cause serious injury if a mistake happens while taking them. This means that it is very important for you to know about this medicine and take it exactly as directed.

Top 10 List of Safety Tips for Oxycodone with Acetaminophen

When filling your prescription

- ❑ **1 Check your medicine.** If your doctor prescribes this medicine using one of its brand names, it could be confused with other medicines that have similar names. For example, a handwritten prescription for Endocet might be mistaken as Indocin. Percocet might be mistaken as Percodan. Roxicet may be mistaken as Roxanol. Tylox might be mistaken as Trimox. When you pick up your prescription at the pharmacy, be sure you have the right medicine.

When taking your medicine

- ❑ **2 Do not take with other acetaminophen medicines.** This pain reliever has two active ingredients: oxycodone and acetaminophen (also known as **Tylenol**, and often abbreviated as **APAP**). Too much acetaminophen can damage the liver and cause death. While taking oxycodone with acetaminophen, do not take nonprescription acetaminophen or other medicines that contain acetaminophen, including many **cold medicines**. Adults should not take more than 3,000 to 4,000 mg of acetaminophen each day. Depending on what your doctor prescribed, each tablet or liquid dose of this medicine contains between 300 mg and 650 mg of acetaminophen.

- ❑ **3 Report all medicines.** Let your doctor and pharmacist know about all the prescription and nonprescription medicines you are taking, so other medicines that contain acetaminophen can be identified.

- ❑ **4 Read medicine labels.** Always read the active ingredients on medicine labels (under **Drug Facts** on nonprescription medicine labels) to avoid taking other medicines that contain acetaminophen.

- ❑ **5 Take precautions.** You may feel sleepy while taking this medicine. Avoid tasks that require mental alertness, such as driving or operating machinery. Avoid drinking alcohol while taking this medicine.

- ❑ **6 Prevent and treat constipation.** Constipation is a common side effect when taking this medicine for more than a few days. Exercising, eating fiber, and drinking water can help, but you may need to ask your doctor or pharmacist to recommend a laxative. If your constipation seems severe or does not respond to laxatives, call your doctor. This can be a sign of a blockage in your bowels, a rare but serious side effect.

When discarding unused medicine

- ❑ **7 Dispose of medicine safely.** Oxycodone is a drug with a high potential for abuse. As a precaution, this medicine is one of just a few medicines that the US Food and Drug Administration says must be flushed down the toilet for disposal rather than discarded in the trash.

When you should call your doctor

- ❑ **8 Unrelieved pain.** Call your doctor if the pain gets worse while taking the medicine, or if the medicine does not help control your pain. Do not take extra doses. **Taking too much medicine can be fatal** because it can slow or stop your breathing.

Call

- ❑ **9 Signs of overdose.** Call your doctor if you experience extreme fatigue, difficulty waking up, and/or shallow or very slow breathing.
- ❑ **10 Signs of withdrawal.** Long-term use of oxycodone can lead to dependence. Abruptly stopping the medicine after long-term use can lead to withdrawal symptoms (e.g., dilated pupils, runny nose, sweating, flushed face, flu-like symptoms, irritability, rapid breathing). Seek medical help if these symptoms occur.
